Art Unit: 2165

DETAILED ACTION

Remarks

- 1. In response to communications filed on 13 August 2007, claim(s) 1, 15, 19-20 and 23 is/are amended and claims 21 and 24 is/are cancelled per Applicant's request. Therefore, claims 1-20 and 23 are presently pending in the application, of which, claim(s) 1, 15, 18-20 and 23 is/are presented in independent form.
- 2. In light of Applicant's amendments, the objections to claims 21 and 24 have been withdrawn.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1-9, 12-21 and 23-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over <u>Apfel</u> (U.S. Pat. No. 6,973,299) in view of <u>McIntyre</u> (U.S. Pat. No. 7,111,317).

As to claim 1, Apfel teaches an electronic device (see figure 3) comprising:

Art Unit: 2165

a user input device (see figure 3);

memory means storing computer program instructions (see figure 3); and

a processor operable under the control of the computer program instructions to provide a database application (see figure 2, mobile phone 260), wherein the database application is arranged to enable a user to access personal data organized as a plurality of entries in a database (see column 3, line 10), where each of the plurality of entries is associated with a different person and has one or more alphanumeric text fields and an image field and using the captured image as an image field of an entry of the database (see column 5, lines 53-56).

Apfel does not explicitly teach

a digital camera; and

a camera control application arranged to enable the user to control the device using the user input device to capture an image via the digital camera and to present a user selectable option, on capturing an image, for entering the database application.

McIntyre teaches an electronic device (see Abstract) comprising:

a digital camera (see column 3, line 38, "image capture device"); and

a camera control application arranged to enable the user to control the electronic device using the user input device to capture an image via the digital camera and to present a user selectable option, on capturing an image, for entering the database application (see columns 12-13, spanning paragraph, particularly column 12, lines 61-62, "after taking a picture").

Art Unit: 2165

....

Therefore, it would have been obvious to one of ordinary skill in the relevant art

at the time the invention was made to have modified Apfel by the teaching of McIntyre

because "[f]orms of communication for the one or more contacts include [...] multimedia

message service (MMS)" (see Apfel, column 3, lines 52-55) and MMS messages are a

well-known feature in camera phones. Furthermore, McIntyre anticipates the use of

cellular phones at line 17 of column 22.

As to claims 2 and 17, Apfel, as modified, teaches wherein the camera control

application is arranged to immediately present a plurality of user-selectable options on

capturing an image including an option for using the captured image as an image field

of an entry of the database (see McIntyre, column 12, lines 61-62, "The message can

be selected by the camera user after taking a picture" implies that there is a plurality of

messages that can be selected).

As to claim 3, Apfel, as modified, teaches wherein the camera control application

is arranged to transfer the captured image from storage in a first memory to permanent

storage in the database (This limitation is inherent in any computer system. Data is

stored in "fast" memory while being used by the processor (either RAM or, broadly,

internal registers in the CPU) and moved to "slow" memory for permanent storage. See

column 10, lines 45-50).

Art Unit: 2165

As to claim 4, <u>Apfel</u>, as modified, teaches wherein the camera control application is arranged to control the creation of a new entry in the database (see column 3, line 16, "as new information becomes available").

As to claim 5, <u>Apfel</u>, as modified, teaches wherein the camera control application is arranged to control the amendment of an existing entry in the database (see column 3, line 20, "update processing").

As to claim 6, <u>Apfel</u>, as modified, teaches wherein the user input device enables a user to selectively use either the database application or the camera control application (See column 8, lines 41-62. <u>Apfel</u> anticipates various software applications executing on the phone).

As to claim 7, <u>Apfel</u>, as modified, teaches wherein the user input device is the keypad of a mobile telephone (see figure 3 and see column 8, lines 26-40 and see Abstract).

As to claim 8, <u>Apfel</u>, as modified, teaches wherein the database application functions as at least a telephone book (see column 5, lines 35-36, "mobile phone number").

Art Unit: 2165

As to claim 9, <u>Apfel</u>, as modified, teaches wherein each one of the plurality of database entries has at least one alphanumeric text field for storing a telephone number (see column 5, lines 35-36, "mobile phone number").

As to claim 12, <u>Apfel</u>, as modified, teaches wherein the processor is operable under the control of computer program instructions to provide an image viewing application, wherein selection of a first one of the plurality of user selectable options, makes the captured image accessible, via the database application, as an image field of a database entry (see Examiner's comments regarding claims 1 and 2) and wherein selection of a second one of the plurality of user selectable options makes the captured image available via the image viewing application (see <u>McIntyre</u>, column 8, lines 25-29).

As to claim 13, <u>Apfel</u>, as modified, teaches further comprising a temporary memory for temporarily storing a captured image (see Examiner's comments regarding claim 3 and see column 11, line 45, "RAM").

As to claim 14, <u>Apfel</u>, as modified, teaches wherein the processor is operable under the control of computer program instructions to provide an image viewing application, and the camera control application is arranged to transfer the captured image from temporary storage in the temporary memory to permanent storage accessible by the viewing application (see Examiner's comments regarding claims 12 and 13).

Art Unit: 2165

As to claim 15, Apfel teaches a method (see Abstract), comprising:

For the remaining steps of this claim applicant(s) is/are directed to the remarks and discussions made in claim 1 above.

As to claim 16, <u>Apfel</u>, as modified, teaches wherein the first application, on capturing an image, immediately enables a user to assign the captured image to an image field of a database entry (see Examiner's comments regarding claim 1).

As to claim 18, <u>Apfel</u>, as modified, teaches an electronic device (see Abstract) comprising:

For the remaining steps of this claim applicant(s) is/are directed to the remarks and discussions made in claim 1 above.

As to claim 19, Apfel, as modified, teaches a method (see Abstract), comprising:

For the remaining steps of this claim applicant(s) is/are directed to the remarks and discussions made in claim 1 above.

As to claim 20, <u>Apfel</u>, as modified, teaches a computer readable medium encoded with a computer program (see Abstract) comprising:

For the remaining steps of this claim applicant(s) is/are directed to the remarks and discussions made in claim 1 above.

Art Unit: 2165

As to claim 23, Apfel, as modified, teaches a computer readable medium

encoded with a computer program (see Abstract) comprising:

For the remaining steps of this claim applicant(s) is/are directed to the remarks

and discussions made in claim 1 above.

5. Claims 10-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Apfel as applied to claims 9 and 1 above, respectively, and further in view of Morita

(U.S. Pat. No. 6,766,018).

As to claim 10, Apfel, as modified, still does not teach operating as a telephone,

further comprising a display, wherein the processor is responsive to an incoming call to

display an image from the image field of a database entry that has an alphanumeric text

field corresponding to the telephone number originating the incoming call.

Morita teaches operating as a telephone, further comprising a display, wherein

the processor is responsive to an incoming call to display an image from the image field

of a database entry that has an alphanumeric text field corresponding to the telephone

number originating the incoming call (see column 1, lines 38-40).

Therefore, it would have been obvious to one of ordinary skill in the relevant art

at the time the invention was made to have further modified Apfel by the teaching of

Morita because "It should be noted however, that as mobile phones become more

sophisticated, they are beginning to incorporate many of the components illustrated for

conventional computer 620. Accordingly, with relatively minor adjustments, mostly with respect to input/output devices, the description of conventional computer 620 applies equally to mobile phones" (see Apfel, column 11, lines 35-41).

As to claim 11, Apfel, as modified, still does not teach wherein an entry of the database can be selected by a user by scrolling the image fields of the database.

Morita teaches wherein an entry of the database can be selected by a user by scrolling the image fields of the database (see column 1, lines 35-37).

Therefore, it would have been obvious to one of ordinary skill in the relevant art at the time the invention was made to have further modified Apfel by the teaching of Morita because "It should be noted however, that as mobile phones become more sophisticated, they are beginning to incorporate many of the components illustrated for conventional computer 620. Accordingly, with relatively minor adjustments, mostly with respect to input/output devices, the description of conventional computer 620 applies equally to mobile phones" (see Apfel, column 11, lines 35-41).

Response to Arguments

6. Applicant's arguments filed on 13 August 2007 with respect to the rejected claims in view of the cited references have been fully considered but are not deemed persuasive.

Art Unit: 2165

In response to Applicant's arguments that McIntyre does not teach presenting "a user selectable option, on capturing an image, for entering the database application", the arguments have been fully considered but are not deemed persuasive. The limitation in question begins "a camera control application arranged to enable" (emphasis added). The rest of the limitation is considered intended use, because it merely describes a capability of the claimed invention and is not positively recited.

McIntyre teaches a camera control application (see, for example, line 59 of column 4).

See MPEP 2111.04. This problem can be found throughout the claims; several other phrases that render limitations as intended use are "to provide", "providing" and "operable ... to". In effect, the claimed invention is a camera, an input device, memory and a processor. These elements are taught by the combination of Apfel and McIntyre. Any processor is "operable ... to provide" any number of programs, and thus would anticipate the claimed invention.

Due to this deficiency, Applicant's arguments are moot. However, in the interest of expediting prosecution, they will be addressed.

At line 61 of column 12, McIntyre discloses a user optionally recording text to a magnetic medium after taking a picture. The limitation requires that the user is presented with an option to enter the database after taking a picture. The recording of text is equivalent to entering the database because the data on the film is considered a database. "Entering" a database has no special meaning in the art and recording data could be reasonably considered "entering". Thus, the claim limitations are met.

Application/Control Number: 10/663,477 Page 11

Art Unit: 2165

In response to Applicant's arguments that <u>Apfel</u> and <u>McIntyre</u> do not teach "a messaging application for providing or receiving an image in a message", the arguments have been fully considered but are not deemed persuasive. <u>Apfel</u> teaches cell phones with MMS capabilities (see column 3, lines 54-55). MMS messages contain images. <u>Apfel</u> also teaches synchronizing pictures (see column 7, line 52).

Conclusion

7. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

8. Any inquiry concerning this communication or earlier communications should be directed to the examiner, Mark A. Radtke. The examiner's telephone number is (571)

Application/Control Number: 10/663,477 Page 12

Art Unit: 2165

272-7163, and the examiner can normally be reached between 9 AM and 5 PM, Monday through Friday.

If attempts to contact the examiner are unsuccessful, the examiner's supervisor, Jeffrey Gaffin, can be reached at (571) 272-4146.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to Customer Service at (800) 786-9199.
